

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

PREFACE.

TO MOST practical engineers and draftsmen who have to design girders and roofs, with little time to spare for mathematical investigation and calculation, the majority of the text-books on this subject are too abstruse.

In this work an attempt has been made to simplify the matter by giving stress constants for both dead and live loads, which only require to be multiplied by the panel load to give the maximum stress in any member of a truss, under the conditions which will be found in the text.

The Author does not wish to claim originality for the idea of calculating the stresses due to dead and live loads in the terms of a unit panel load, but he trusts it has been put into a practical shape, suitable alike to the wants of Civil and Mechanical Engineers, Architects and Draftsmen. No attempt has been made in any way to go beyond the subject, and the one hundred cases for which stress constants are given, will, it is hoped, be found suitable for every-day practice.

F. R. J.

BOMBAY: 1894.

NOTE.

As in a work of this kind accuracy is the first consideration, no effort has been spared to avoid errors.

The stress constants have been, as far as possible, determined in two or three different ways, and the results compared.

The signs $+$ and $-$ have also been very carefully checked, and the Author believes that those who do him the honour to use this little book will not find their confidence misplaced.

It need hardly be remarked that, both in the case of the girder and roof trusses, the loads are supposed to rest only at the joints, through the agency of cross girders, purlins, &c., and that if any portion of the load is otherwise laid on, the transverse stress caused thereby must be allowed for.

In conclusion, the Author hopes that these stress constants will lighten the labours of many who, like himself, are identified with the profession of engineering.

Roof Trussings for large or small spans

Bridges of every description

Angles and Tees in Iron or Steel

Iron doors

Large or small sections of Channel iron

Spiral or straight Stairs

Girders made to any size and can be supplied at once from the stock list of plates & angles

English or Foreign rolled iron or steel Joists from 3 to 20 inches deep always in stock

Girders made in a few hours

Chequered Plates

Wrought Cast iron Sashes

Ornamental or plain cast iron columns in stock

Cast and wrought iron or Steel Staircases

Section sheets & books free on application

STRESSES IN GIRDER AND ROOF TRUSSES BY SIMPLE MULTIPLICATION.

PART I.—GIRDERS.

INTRODUCTORY.

1. ABBREVIATIONS.

S = Stress in. + = Compression. - = Tension.

For Unit Panel Load see Fig. 1.

2. STRESS CONSTANTS FOR DEAD LOAD.

These are the stresses in each member of the girder when each panel is covered with a unit load. Taking Truss Diagram No. 1 as an example with a load of 1 ton, 1 kilogramme, or any other unit distributed over each of the twelve panels on the bottom flange, the stress constants are the resulting stresses in terms of the load.

3. MAXIMUM STRESS CONSTANTS FOR LIVE LOAD.

These are the maximum stresses in each member of the girder which could be caused by a unit load per

panel advancing from the left abutment, and crossing the girder to the right abutment, or *vice versa*.

Taking Truss Diagram No. 1 as an example with a load of 1 ton, 1 kilogramme, or any other unit per panel advancing from either abutment, and crossing the girder on the bottom flange, the stress constants are the resulting maximum stresses in terms of the load.

4. REFERENCE NUMBERS.

The numbers on the Truss Diagrams serve to indicate each member of a girder for which the stress constant is given. Taking Truss Diagram No. 1 as an example, under the head "Evenly distributed Dead Load, Stress Constants, Top Flange," will be found S. 1·3, and opposite, the stress constant $+ 5·50$.

This means that the stress in the member 1·3 of Truss Diagram No. 1, due to a dead load of unit panel intensity, is compression 5·50.

5. POSITION OF LOAD.

It will be noticed that for each diagram the dead load is supposed to be concentrated wholly on one flange.

As regards the parallel girders; in cases where this would not be considered sufficiently accurate half the stresses can be calculated from the stress constants belonging to the truss diagram where the load is on the top flange, and the other half from the constants for the diagram where the load is on the bottom flange.

6. THE DYNAMIC METHOD FOR AUGMENTED STRESSES.

The stress constants are equally applicable for calculating the augmented stresses resulting from the dynamic method for proportioning the members of a girder to resist suddenly applied loads.

7. THEORETICALLY IMPERFECT GIRDERS.

It is hardly necessary to observe that in the case of theoretically imperfect girders, i. e. those having a redundancy of parts (Truss Diagram No. 14 for instance), certain assumptions have been made as to the way the stresses will go, which of course it is practically difficult to make certain of, and in these cases the only thing to do is to see that the sectional area is sufficient for the worst combination.

8. DIFFERENCE BETWEEN PARABOLIC BOWSTRING GIRDER AND BRACED ARCH.

It is well to state that an essential difference exists between a parabolic bowstring girder and a parabolic braced arch.

In the former case the maximum stress in the bow results when the whole bridge is covered with the live load, but in the latter case it is not so.

9. CONCENTRATED AXLE LOADS AND EFFECTIVE LIVE LOAD.

In English practice it is generally considered sufficient to use the "effective live load" when calculating the stresses in the flanges and bracing.

By "effective live load" is meant the corresponding evenly distributed load, which causes an equivalent stress in the flanges at the centre, to that which results from the worst possible combination of concentrated axle loads.

In cases where this is not considered sufficiently accurate, the method proposed by Mr. Claxton Fidler might be adopted, viz. to calculate the stresses for the

ordinary train load (using the stress constants in the following pages), and then work out the stresses caused by the excess engine load per foot, for one or two engine lengths, as may be decided on, and add the results to the former calculation. The excess load can also be taken as a uniform weight per foot, i. e. weight of engine divided by length over buffers minus train load per foot first taken.

To calculate the exact stresses due to the separate axle loads would, except in the case of very small spans, be an unnecessary refinement, particularly when, as is usual now, some allowance is made for impact, which must necessarily be more or less approximate.

It will therefore generally be quite sufficient for all practical purposes to use the "effective live load" in calculating the stresses, and as proposed by Mr. Claxton Fidler, to add the difference between the maximum and minimum stresses to the maximum stresses in the bracing, and half the difference in the case of the flanges, afterwards using a factor of safety of 3 to 4.

Vertical suspenders which carry the roadway, and other verticals which are supposed to distribute the load between the top and bottom flanges, must be made strong enough to bear any concentrated axle load which may come on them, and where the cross girders are spaced further apart than the engine wheels, this would be exceeded by a proportional part of one or more adjacent axle loads.

End posts, when the load is on the top flange, would have this concentrated load to bear, in addition to any possible stress caused by the bracing, and, referring to paragraph 7, it is in all cases necessary to look practically into these matters, when the quantity of metal in the various parts of the truss comes to be apportioned.

10. FULLY WORKED OUT EXAMPLE.

As an example, the stresses will be calculated in detail for a single line through bridge consisting of two girders of the type shown in Truss Diagram No. 20. Span 60 feet. Dead load 0.5 ton per lineal foot, and effective live load 1.5 tons per lineal foot.

The panels loads for one girder will therefore be 6 feet \times 0.5 ton \div 2 = $1\frac{1}{2}$ tons for dead load, and 6 feet \times 1.5 tons \div 2 = $4\frac{1}{2}$ tons for live load.

The stresses are as follows :

For Dead Load.

Top flange :		Tons
S. 1.3 = stress constant	$2.00 \times 1\frac{1}{2}$ tons panel load =	+ 3.00
3.5	$6.00 \times 1\frac{1}{2}$	+ 9.00
5.7	$9.00 \times 1\frac{1}{2}$	+ 13.50
7.9	$11.00 \times 1\frac{1}{2}$	+ 16.50
9.11	$12.00 \times 1\frac{1}{2}$	+ 18.00

Bottom flange:

S. 2.4 = stress constant	$2.50 \times 1\frac{1}{2}$ tons panel load =	- 3.75
4.6	$6.50 \times 1\frac{1}{2}$	- 9.75
6.8	$9.50 \times 1\frac{1}{2}$	- 14.25

1·4	—	6·34	7·10	+	0·84
3·6	+	0·14	7·10	—	2·95
3·6	—	5·07	9·12	+	1·41
5·8	+	0·42	9·12	—	2·11

Note.—The parts 2·4 would practically be made of the same strength as 4·6 and 11·12 the same as 9·10.

TRUSS DIAGRAM No. 16.

LINVILLE.

CONDITIONS.

1. Depth $\frac{1}{10}$ of the span.
2. Number of panels 10.
3. Method of loading On top flange.
4. Description of bracing .. Verticals and diagonals, angle 45° .

EVENLY DISTRIBUTED DEAD LOAD.

Stress Constants.

Top flange:

S. 1·3	+	4·50	S. 7·9	+	12·00
3·5	+	8·00	9·11	+	12·50
5·7	+	10·50			

Bottom flange:

S. 2·4	-	0·00	S. 8·10	-	10·50
4·6	-	4·50	10·12	-	12·00
6·8	-	8·00			

Vertical bracing all struts under dead load:

S. 1·2	+	5·00	S. 7·8	+	2·50
3·4	+	4·50	9·10	+	1·50
5·6	+	3·50	11·12	+	1·00

Diagonal bracing all ties under dead load:

S. 1·4	-	6·34	S. 7·10	-	2·11
3·6	-	4·93	9·12	-	0·70
5·8	-	3·52			

EVENLY DISTRIBUTED LIVE LOAD ADVANCING FROM
EITHER ABUTMENT.

Maximum Stress Constants.

Top flange:

S. 1·3	+	4·50	S. 7·9	+	12·00
3·5	+	8·00	9·11	+	12·50
5·7	+	10·50			

Bottom flange:

S. 2·4	-	0·00	S. 8·10	-	10·50
4·6	-	4·50	10·12	-	12·00
6·8	-	8·00			

Vertical bracing:

S. 1·2	+	5·00	7·8	+	2·80
1·2	-	0·00	7·8	-	0·30
3·4	+	4·50	9·10	+	2·10
3·4	-	0·00	9·10	-	0·60
5·6	+	3·60	11·12	+	1·00
5·6	-	0·10	11·12	-	0·00

Diagonal bracing:

S. 1·4	+	0·00	S. 5·8	-	3·94
1·4	-	6·34	7·10	+	0·85
3·6	+	0·14	7·10	-	2·96
3·6	-	5·07	9·12	+	1·41
5·8	+	0·42	9·12	-	2·11

Note.—If the truss is supported at the points 2·2 the parts 2·4 would practically be made of the same strength as 4·6, but if supported at the points 1·1 the parts 1·2 and 2·4 are not necessary.

2. Number of panels 5.
3. Method of loading On top flange.
4. Description of bracing .. Vertical and inclined, angle $63^{\circ} 26'$.

EVENLY DISTRIBUTED DEAD LOAD.

Stress Constants.

Top flange:

S. 1·3	+	4·000
3·5	+	6·000
5·5	+	6·000

Bottom flange:

S. 1·2	-	4·472
2·4	-	4·000
4·4	-	6·000

Vertical bracing:

S. 2·3	+	2·000
4·5	+	1·000

Inclined bracing:

S. 3·4	-	2·236
5·4	-	0·000

EVENLY DISTRIBUTED LIVE LOAD ADVANCING FROM
EITHER ABUTMENT.

Maximum Stress Constants.

Top flange:

S. 1·3	+	4·000
3·5	+	6·000
5·5	+	6·000

Bottom flange:

S. 1·2	-	4·472
2·4	-	4·000
4·4	-	6·000

Vertical bracing:

S. 2·3	+	2·000	S. 4·5	+	1·200
2·3	-	0·000	4·5	-	0·200

Inclined bracing:

S. 3·4	+	0·447	S. 5·4	+	1·341
3·4	-	2·683	5·4	-	1·341

Note.—In this type of truss it is usual to make the diagonals capable of sustaining tension only, and in that case, with a moving load, another diagonal would be required in the centre panel to relieve 5·4 of compression and possibly other diagonals in the side panels; but this would depend upon the relative values of the dead and live loads.

If this truss is turned upside down the stresses remain the same, but the signs + and - are reversed.

22

23

24

TRUSS DIAGRAM No. 25.

INVERTED LINVILLE.

CONDITIONS.

1. Depth $\frac{1}{10}$ of the span.
2. Number of panels 6.
3. Method of loading On top flange.
4. Description of bracing .. Vertical, and inclined angle $59^{\circ} 2'$.

EVENLY DISTRIBUTED DEAD LOAD.

Stress Constants.

Top flange:

S. 1·3	+	4·165
3·5	+	6·664
5·7	+	7·500

Bottom flange:

S. 1·2	-	4·857
2·4	-	4·165
4·6	-	6·664

Vertical bracing:

S. 2·3	+	2·500
4·5	+	1·500
6·7	+	1·000

Inclined bracing:

S. 3·4	-	2·914
5·6	-	0·971

EVENLY DISTRIBUTED LIVE LOAD ADVANCING FROM
EITHER ABUTMENT.

Maximum Stress Constants.

Top flange:

S. 1·3	+	4·165
3·5	+	6·664
5·7	+	7·500

Bottom flange:

S. 1·2	-	4·857
2·4	-	4·165
4·6	-	6·664

Vertical bracing:

S. 2·3	+	2·500	S. 4·5	-	0·166
2·3	-	0·000	6·7	+	1·000
4·5	+	1·666	6·7	-	0·000

Inclined bracing:

S. 3·4	+	0·322	S. 5·6	+	0·971
3·4	-	3·237	5·6	-	1·943

Note.—In this type of truss it is usual to make the diagonals capable of sustaining tension only, and in that case with a moving load cross diagonals would be required in some of the panels, depending upon the relative values of the dead and live loads.

If this truss is turned upside down the stresses remain the same, but the signs + and - are reversed.

6·8	-	10·11			

Vertical bracing:

S. 1·2	+	4·500
1·2	-	0·000
3·4	+	4·000
3·4	-	0·000
5·6	+	3·111
5·6	-	0·111
7·8	+	2·333
7·8	-	0·333
9·10 (vertical)	+	1·666
9·10 (vertical)	-	0·666

Inclined bracing:

S. 1·4	+	0·000
1·4	-	7·028
3·6	+	0·195
3·6	-	5·467
5·8	+	0·579
5·8	-	4·093
7·10	+	1·159
7·10	-	2·916
9·10 (diagonal)	+	1·950
9·10 (diagonal)	-	1·950

Note.—If this truss is supported at the points 2·2 the parts 2·4 would practically be made of the same strength as 4·6, but if supported at the points 1·1 the parts 1·2 and 2·4 are not necessary.

TRUSS DIAGRAM No. 34.

GANTRY.

CONDITIONS.

1. Depth at centre $\frac{1}{8}$ of the span.
2. Number of panels 3.
3. Method of loading On top flange.
4. Description of bracing .. Vertical and inclined, angle $69^{\circ} 26'$.

EVENLY DISTRIBUTED DEAD LOAD.

Stress Constants.

Top flange:

S. 1·3	+	2·666
3·3	+	2·666

Bottom flange:

S. 1·2	-	2·847
2·2	-	2·666

Vertical bracing:

S. 2·3	+	1·000
--------	----	----	----	---	-------

Inclined bracing:

S. 2·3		0·000
--------	----	----	----	--	-------

TRUSS DIAGRAM No. 45.

PARABOLIC BOWSTRING.

CONDITIONS.

1. Depth at centre $\frac{1}{4}$ of the span nearly.
2. Number of panels 13.
3. Method of loading On bottom flange.
4. Description of bracing .. Vertical, and inclined two ways.

EVENLY DISTRIBUTED DEAD LOAD.

Stress Constants.

Top flange:

S. 2·3	+	14·31	S. 9·11	+	13·16
3·5	+	13·92	11·13	+	13·04
5·7	+	13·60	13·13	+	13·08
7·9	+	13·34			

Bottom flange:

S. 2·4	-	13·08	S. 10·12	-	13·08
4·6	-	13·08	12·14	-	13·08
6·8	-	13·08	14·14	-	13·08
8·10	-	13·08			

Vertical bracing:

S. 3·4	-	1·00	S. 9·10	-	1·00
5·6	-	1·00	11·12	-	1·00
7·8	-	1·00	13·14	-	1·00

Inclined bracing:

S. 3·6	0·00	S. 9·12	0·00
5·8	0·00	11·14	0·00
7·10	0·00	13·14	0·00

EVENLY DISTRIBUTED LIVE LOAD ADVANCING FROM
EITHER ABUTMENT.

Maximum Stress Constants.

Top flange:

S. 2.3 + 14.31	S. 9.11 + 13.16
3.5 + 13.92	11.13 + 13.04
5.7 + 13.60	13.13 + 13.08
7.9 + 13.34	

Bottom flange:

S. 2.4 - 13.08	S. 10.12 - 13.08
4.6 - 13.08	12.14 - 13.08
6.8 - 13.08	14.14 - 13.08
8.10 - 13.08	

Vertical bracing:

S. 3.4 + 0.000	S. 9.10 + 0.922
3.4 - 1.000	9.10 - 1.922
5.6 + 0.385	11.12 + 1.077
5.6 - 1.385	11.12 - 2.077
7.8 + 0.692	13.14 + 1.153
7.8 - 1.692	13.14 - 2.153

Inclined bracing:

S. 3.6 + 1.101	S. 9.12 + 1.708
3.6 - 1.101	9.12 - 1.708
5.8 + 1.309	11.14 + 1.835
5.8 - 1.309	11.14 - 1.835
7.10 + 1.527	13.14 + 1.900
7.10 - 1.527	13.14 - 1.900

Note.—The depth at the centre of the girder is not quite $\frac{1}{4}$ th of the span, owing to the top flange, 13.13, being straight instead of curved. This causes the horizontal stress to be 13.08 instead of 13.00.

TRUSS DIAGRAM No. 46.

PARABOLIC BOWSTRING.

CONDITIONS.

1. Depth at centre $\frac{1}{4}$ of the span nearly.
2. Number of panels 13.
3. Method of loading On bottom flange.
4. Description of bracing .. Vertical, and inclined one way.

9·14 + 0·528	25·30 - 0·176
9·14 - 2·643	27·32 + 4·318
11·16 + 0·793	27·32 - 0·088
11·16 - 2·203	29·34 + 4·935
13·18 + 1·057	29·34 - 0·000
13·18 - 1·762	31·34 + 4·480
15·20 + 1·414	31·34 - 0·000

Note.—The stresses in the bracing when inclined opposite ways from the centre can easily be determined from these constants, also the stresses in counterbraces if these are added in some of the panels. The parts 2·4 would practically be made of the same strength as 4·6, and 33·34 require particularly to be considered for axle loads.

TRUSS DIAGRAM No. 55.

19·24 + 1·762	39·42 - 0·000

Note.—The stresses in the bracing when inclined opposite ways from the centre can easily be deter-

mined from these constants, also the stresses in counterbraces if these are added in some of the panels. The parts 2·4 would practically be made of the same strength as 4·6, and 41·42 require particularly to be considered for axle loads.

TRUSS DIAGRAMS

57

58

59

PART II.—ROOFS.

INTRODUCTORY.

1. ABBREVIATIONS, &c.

S = Stress in. + = Compression. - = Tension.

FIG. 2.

For Unit Panel Load see Fig. 2.

2. STRESS CONSTANTS FOR DEAD LOAD.

These are the stresses in each member of the roof truss when each panel is covered with a unit load. Taking Truss Diagram No. 72 as an example with a load of 1 ton, 1 kilogramme, or any other unit distributed over each of the eight panels on the principal rafters, the stress constants are the resulting stresses in terms of the load.

3. MAXIMUM STRESS CONSTANTS FOR LIVE LOAD.

These are the maximum stresses in each member of the roof truss which could be caused by a unit wind pressure per panel, acting normally to the principal rafters on one side only (either side indifferently), for Truss Diagrams Nos. 61 to 97, both inclusive, under the conditions of fixing shown in Figs. 3 and 4.

FIG. 3.

FIG. 4.

This arrangement gives the maximum stresses, and although, of course, there may be many cases where the method of fixing may be different, it is almost impossible to say how nearly they may approximate thereto by exigencies of construction, and it is best to be on the safe side.

For Truss Diagrams Nos. 98 to 100, both inclusive, the wind pressure has been supposed to act vertically on one side only (either side indifferently), as if a normal pressure had been taken it would have had, owing to the curved surface of the rafters, a different load value for each panel, which would have been very inconvenient.

Taking Truss Diagram No. 72 as an example with a load of 1 ton, 1 kilogramme, or any other unit per panel acting on all the panels on one side of the roof only (either side indifferently), the stress constants are the resulting maximum stresses in terms of the load.

It will be noticed that the only trusses subject to counter stresses in the bracing are Nos. 97 to 100.

4. REFERENCE NUMBERS.

The numbers on the Truss Diagrams serve to indicate each member of a roof truss for which the stress constant is given.

Taking Truss Diagram No. 72 as an example under the head "Live Load" (Wind Pressure), maximum stress constants will be found S. 6·8, and opposite the stress constant — 4·46.

This means that the stress in the member 6·8 of Truss Diagram No. 72 due to a Live Load (Wind Pressure) of unit panel intensity is tension 4·46.

5. POSITION OF LOAD.

The dead load is supposed to be concentrated wholly on the rafters. This is quite near enough in most cases for all practical purposes.

For very large and heavy roofs some allowance might be made to the tension members for the weight of the tie.

6. NORMAL WIND PRESSURE.

The following table gives the normal wind pressure per square foot for different slopes of roof equivalent to a horizontal wind pressure of 50 lbs. per square foot calculated by Hutton's formula :—

Pitch of Roof.											
10	15	20	21 45 $\frac{1}{2}$ span	25	26 30 $\frac{1}{2}$ span	30	33 30 $\frac{1}{2}$ span	35	40	45 $\frac{1}{2}$ span	50
12·1	18	22·6	25·2	28·8	30·2	33	36·6	37·8	41·6	43	47·6
Normal Wind Pressure in lbs. per square foot.											

7. FULLY WORKED OUT EXAMPLE.

As an example the stresses will be calculated in detail for a roof truss of the type shown in Truss Diagram No. 97 to cover a double line of railway, metre gauge, and two platforms, say 60 feet span, with trusses 8 feet apart, covered with 1-inch teak boarding and mangalore tiles, which makes a very light roof.

The dead load per panel will be length of panel, 6·48 feet \times distance apart of trusses, 8 feet \times weight of boarding, $3\frac{1}{2}$ lbs., plus tiling, $8\frac{1}{2}$ lbs., plus probable weight of truss, say 3 lbs.: total, 15 lbs. per square foot, which makes the panel load 778 lbs., say 0·35 of a ton.

The live load (wind pressure) will be area as above, say 52 square feet \times 25 lbs. normal wind pressure: total, 1300 lbs., say 0·58 of a ton.

The stresses are as follows:—

Rafters:	For Dead Load.	Tons.
S. 1·3 = stress constant	+ 10·72 \times 0·35 ton panel load	+ 3·75
3·5	+ 17·20 \times 0·35	+ 6·02
5·7	+ 17·30 \times 0·35	+ 6·05
7·9	+ 14·37 \times 0·35	+ 5·03
9·11	+ 10·78 \times 0·35	+ 3·77

Tie:		Tons.
S. 1'4 = stress constant	- 10'00 × 0'35 ton panel load	- 3'50
4'6	- 10'59 × 0'35	- 3'70
6'8	- 16'66 × 0'35	- 5'83
8'10	- 16'15 × 0'35	- 5'65
10'12	- 13'41 × 0'35	- 4'69

Bracing:		
S. 3'4 = stress constant	+ 4'00 × 0'35 ton panel load	+ 1'40
5'6	+ 1'10 × 0'35	+ 0'38
7'8	- 1'54 × 0'35	- 0'54
9'10	- 3'33 × 0'35	- 1'16
11'12	- 7'00 × 0'35	- 2'45
